

Exploratory Testing Session Report

Feature Tested: Amazon Search Bar Functionality

Tester: Sakshi

Session Date: Jan15, 2026

Duration: 60 Minutes (Time-Boxed)

1. Test Charter (Our Mission)

"Explore Amazon's search to discover usability and edge-case issues, using the SFDPOT heuristic."

2. Areas Covered & What I Tested

I focused heavily on testing the **Data (D)** and **Time/Gestures (T)** parts of the SFDPOT checklist to see how the search bar handles unexpected user behavior.

- **Extreme Data Inputs:** Tested how the system handles weird inputs like strings of emojis, very long paragraphs (500+ characters), trailing blank spaces, and code-like text.
 - **Interrupting Actions:** Tested rapid clicking behavior and browser navigation mid-load to see if the search engine breaks or freezes.
-

3. Bugs & Observations Found

During my 60-minute session, I logged the following behaviors:

- **Observation 1 (High-Volume Text):** When pasting a massive 500-character block of text into the search bar, the system did not crash. It automatically truncated the text or showed a generic "No results found" page gracefully.
 - **Observation 2 (Emoji Handling):** Searching for just emojis (like 🍕🚀💻) resulted in a clean "No results" page. The app did not throw a technical error code or break the UI layout.
 - **Bug/Usability Issue 1 (Leading Spaces):** When typing multiple empty spaces before a keyword (e.g., `iphone`), the system successfully trimmed the spaces and found the item. However, the auto-suggest dropdown looked misaligned for a split second before updating.
 - **Bug/Usability Issue 2 (Rapid Double-Clicks):** Spatially double-clicking the search magnifying glass icon while a page was actively loading caused the page to stutter and restart the network request twice. This could cause performance lag for users on slower networks.
-

4. Time Spent Breakdown

- **Setup & Charter Creation:** 10 minutes (Setting up my workspace and notes document).
- **Active Testing & Bug Hunting:** 40 minutes (Trying out edge cases, emojis, and rapid browser gestures).
- **Documentation & Wrap-up:** 10 minutes (Organizing notes and writing this final report).

5. Follow-Up Ideas for Next Sessions

- **Platform Testing (P):** Next time, I want to repeat these exact edge-case inputs on a mobile browser (Safari/Chrome mobile view) to see if the layout breaks on smaller screens.
- **Operations Testing (O):** I want to test searching while switching between a logged-in Prime account and a logged-out guest account to see if the auto-suggestions change.
