

Amazon QA Audit: BDD User Stories

Module: Agile Testing & Scrum for QA

Feature under Test: Amazon "Save for Later" Cart Engine

Author: Sakshi

Feature Overview

In Agile development, features are broken down into user stories to capture requirements from an end-user perspective. This document maps out three critical user stories for Amazon's **Save for Later** functionality using the structured **Given-When-Then (Gherkin)** syntax. This ensures clear acceptance criteria for developers and provides an exact blueprint for manual and automated test execution.

User Story 1: Move Item to Save for Later List

As a shopper reviewing my digital shopping cart,

I want to move an item to a "Save for Later" list,

So that I can clear it from my current subtotal but easily track it for a future purchase.

Acceptance Criteria

Scenario 1: Successfully saving an item for later (Positive Path)

- **Given** I am a logged-in shopper viewing my Amazon shopping cart
- **And** I have an "Apple AirPods Pro" in my active cart list
- **When** I click the "Save for Later" button beneath the item details
- **Then** the "Apple AirPods Pro" should be removed from my active shopping cart
- **And** my cart subtotal should automatically recalculate and decrease
- **And** the item should immediately appear in the "Saved for Later" section below the cart

Scenario 2: Moving a saved item back to the active cart (Alternative Path)

- **Given** I have an "Apple AirPods Pro" sitting in my "Saved for Later" list

- **When** I click the "Move to Cart" button next to that item
- **Then** the item should disappear from the "Saved for Later" section
- **And** it should reappear back in my active shopping cart list
- **And** my cart subtotal should automatically increase to include the item's price

Scenario 3: Attempting to save an item while logged out (Negative Path)

- **Given** I am a guest shopper browsing Amazon without logging into an account
- **And** I have added an item to my temporary guest shopping cart
- **When** I click the "Save for Later" button beneath the item
- **Then** the system should redirect me to the Amazon Sign-In page
- **And** a message should display stating: *"Please sign in to save items for later"*

User Story 2: Delete Item from Saved for Later List

As a shopper managing my saved items,

I want to delete an item permanently from my "Saved for Later" list,

So that I can clean up clutter from items I no longer wish to track or purchase.

Acceptance Criteria

Scenario 1: Successfully deleting an item from the Saved for Later list (Positive Path)

- **Given** I am a logged-in shopper viewing my Amazon cart page
- **And** I have a "Wireless Mouse" sitting in my "Saved for Later" list
- **When** I click the "Delete" button next to the "Wireless Mouse" in the saved list
- **Then** the "Wireless Mouse" should be permanently removed from my "Saved for Later" section
- **And** a confirmation message should display stating: *"Wireless Mouse was deleted from Saved for Later"*
- **And** my active cart items and subtotal should remain completely unchanged

Scenario 2: Deleting the last remaining item in the Saved for Later list (Alternative Path)

- **Given** I have exactly one item, "Running Shoes", left in my "Saved for Later" list
- **When** I click the "Delete" button next to the "Running Shoes"
- **Then** the item should be removed from the page
- **And** the "Saved for Later" header text should display a count of 0 items
- **And** the empty saved list placeholder message should be displayed

Scenario 3: Attempting to delete an item when the session has timed out (Negative Path)

- **Given** I have items in my "Saved for Later" list
 - **And** my user authentication session has expired due to inactivity
 - **When** I click the "Delete" button next to any item in the saved list
 - **Then** the system should fail to delete the item
 - **And** the system should redirect me to the log-in verification page to refresh my session
-

User Story 3: Modify Item Quantity in Saved for Later List

As a shopper planning a future purchase,

I want to change the item quantity directly within the "Saved for Later" list,

So that the correct amount is preserved when I eventually move it back to my active cart.

Acceptance Criteria

Scenario 1: Successfully increasing the quantity of a saved item (Positive Path)

- **Given** I am a logged-in shopper viewing my Amazon cart page
- **And** I have a "Yoga Mat" with a quantity of "1" in my "Saved for Later" list
- **When** I change the quantity dropdown selection of the "Yoga Mat" to "3"
- **Then** the "Saved for Later" section should refresh and update the item quantity to "3"
- **And** my active cart items and current subtotal should remain completely unaffected

Scenario 2: Reducing item quantity to the minimum limit (Alternative Path)

- **Given** I have a "Coffee Mug" with a quantity of "2" in my "Saved for Later" list
- **When** I change the quantity dropdown selection of the "Coffee Mug" down to "1"
- **Then** the "Saved for Later" section should refresh and update the item quantity to "1"
- **And** the dropdown menu should prevent selecting a quantity lower than 1

Scenario 3: Attempting to modify quantity when an item goes out of stock (Negative Path)

- **Given** I have a "Limited Edition Book" in my "Saved for Later" list
- **And** the item's total warehouse inventory drops to zero
- **When** I attempt to click the quantity dropdown menu for that item
- **Then** the quantity selector dropdown should be disabled or greyed out
- **And** an alert tag stating *"This item is currently out of stock"* should appear next to the item text
